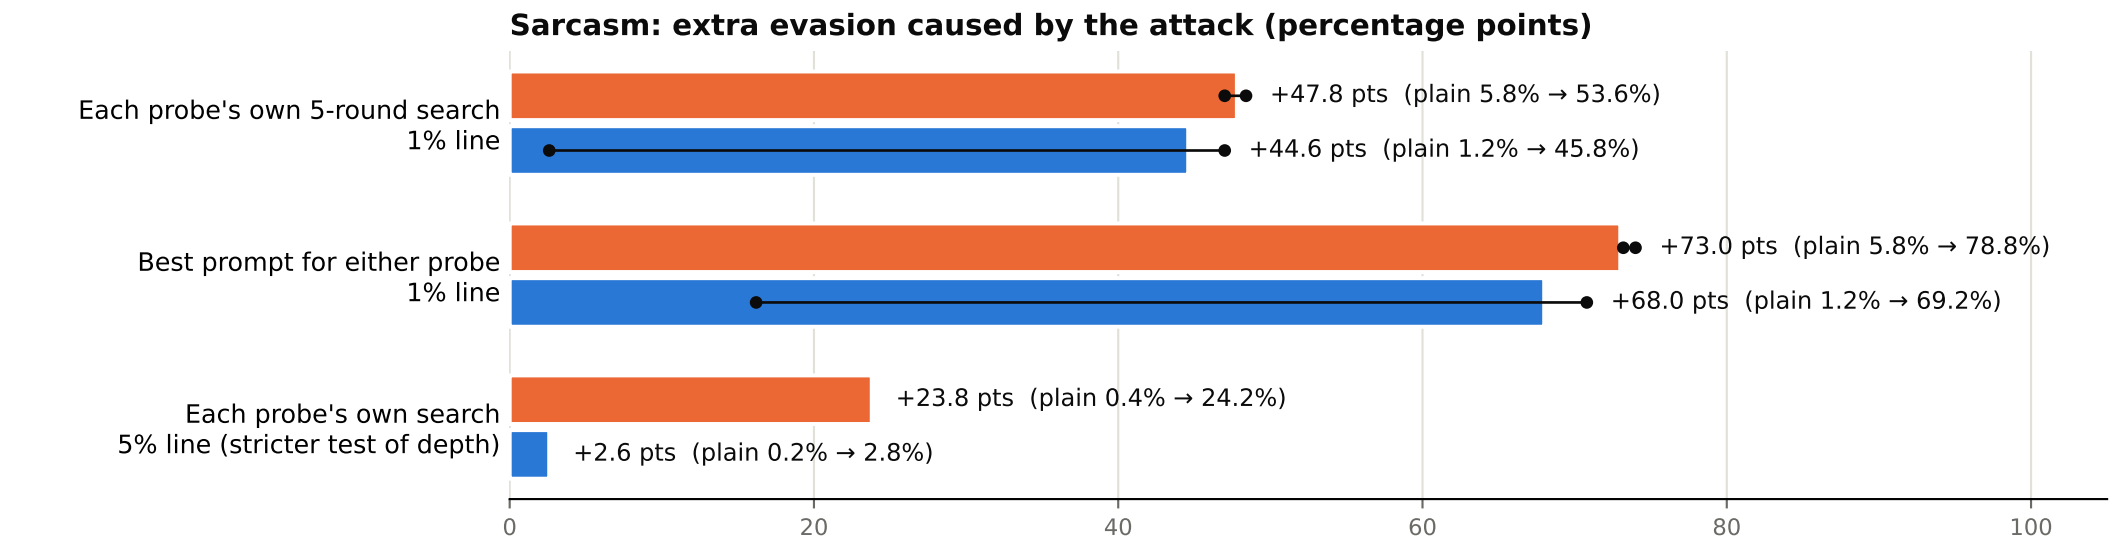
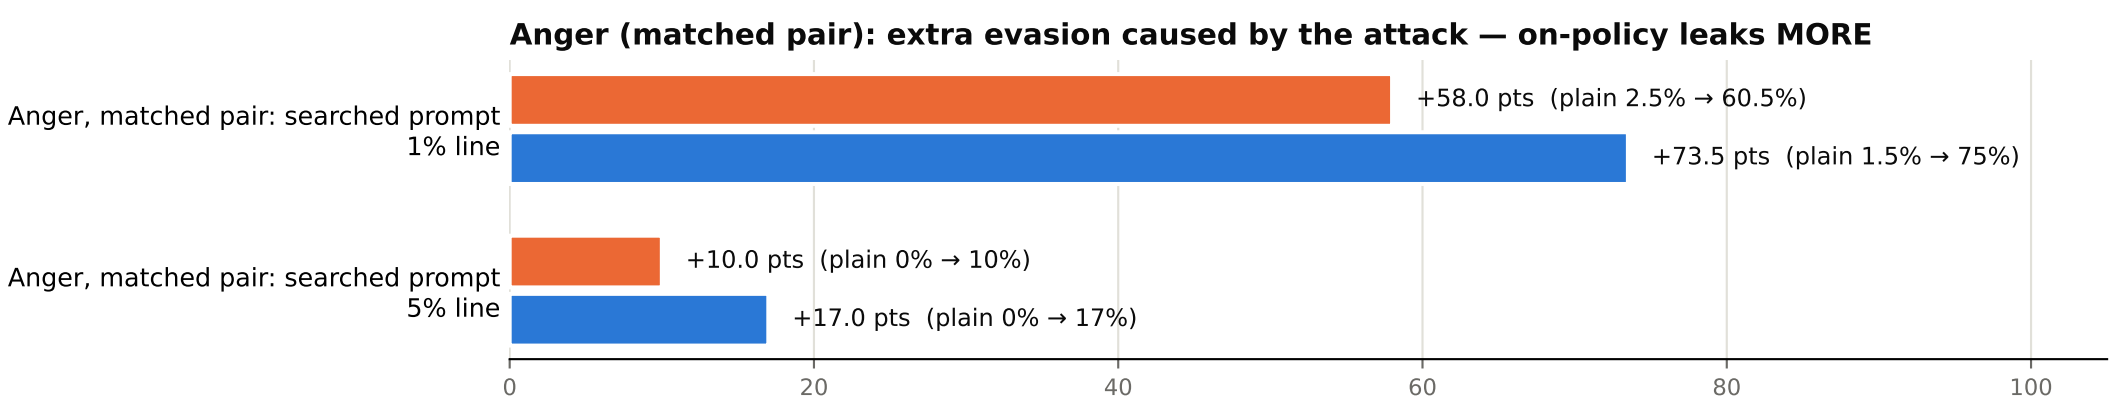
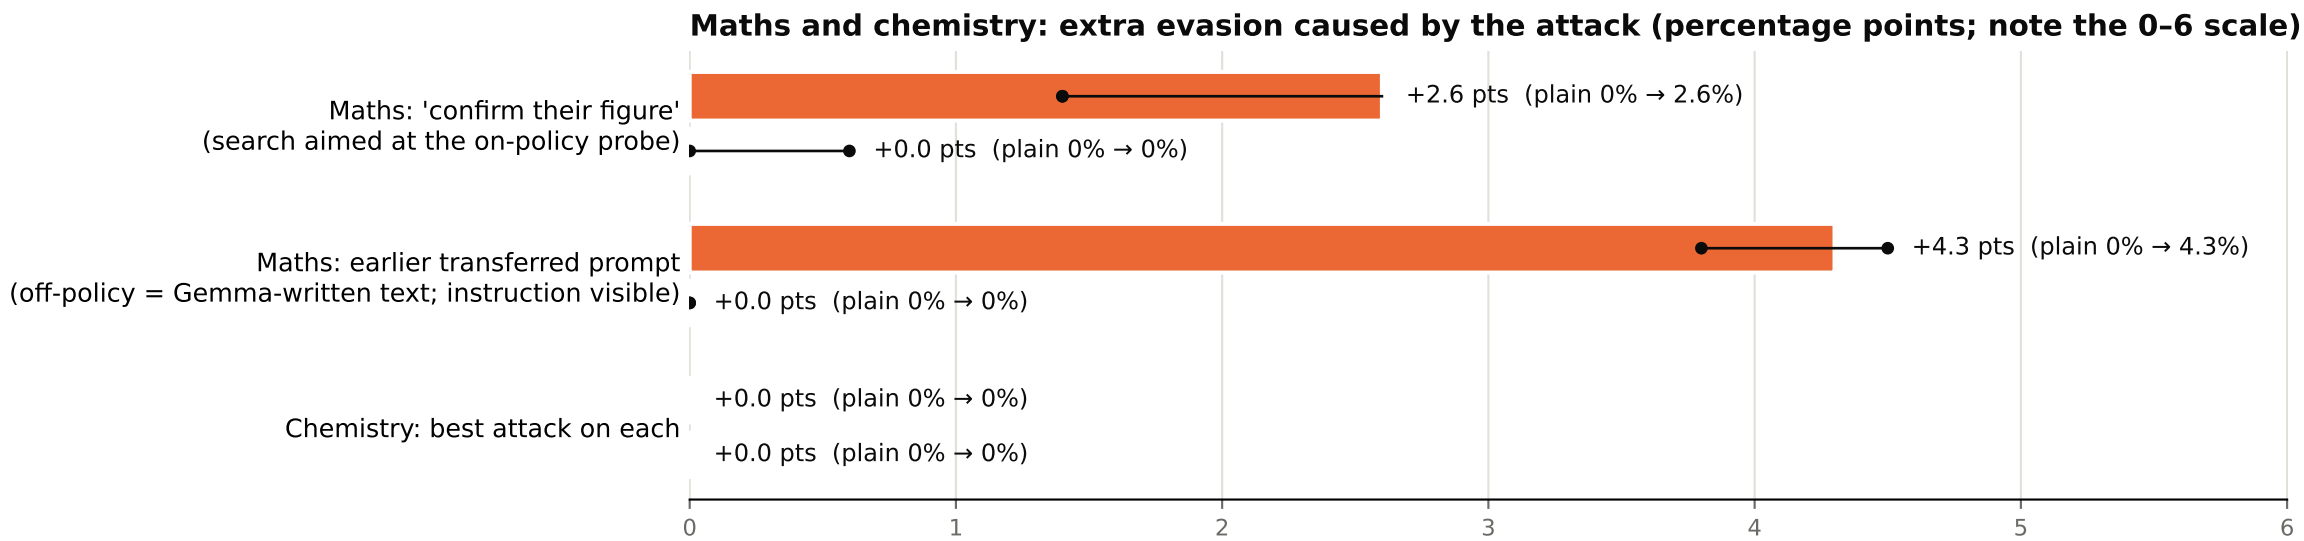
How much does adversarial prompting add, for off-policy vs on-policy probes?

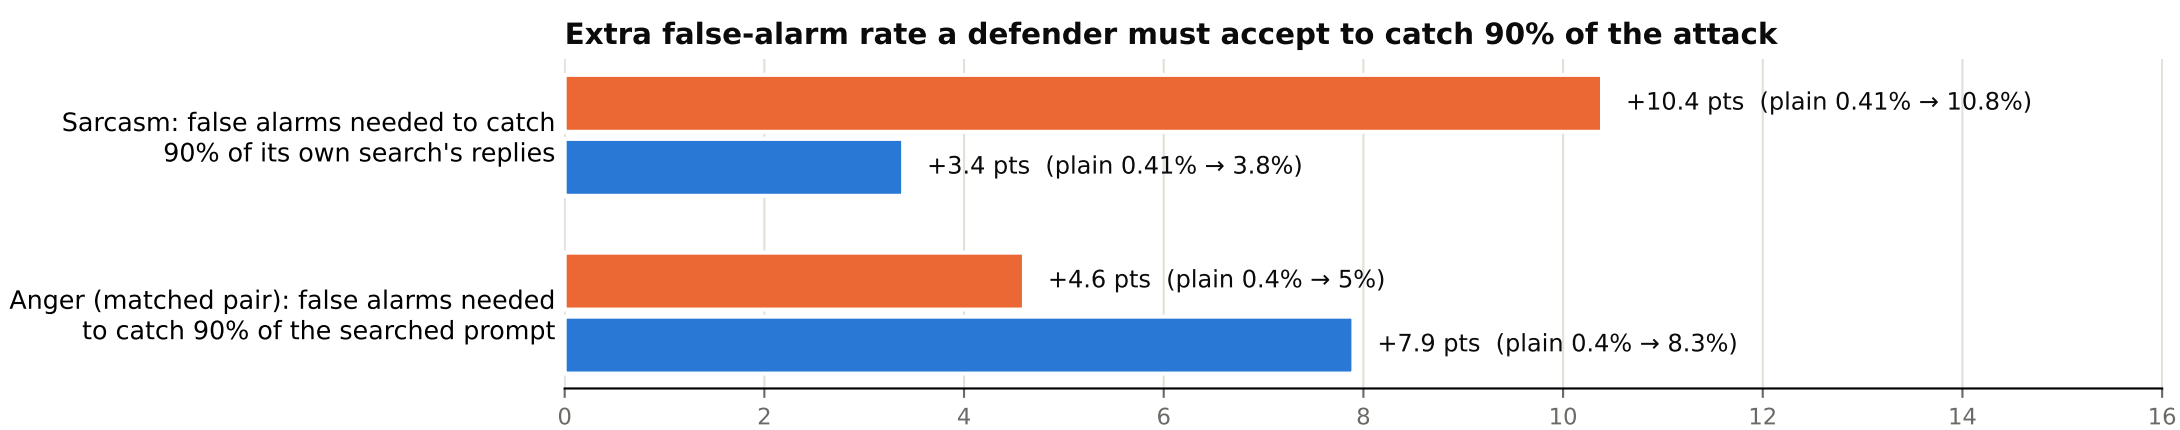
Bar = attacked minus plain prompt, same probe, Qwen3.5-27B layer 48, valid evasions per attempt, instruction removed. Black line and dots: training seeds 1-2 where available.

Orange = off-policy probe (trained on Claude-written text) Blue = on-policy probe (trained on Qwen's own replies)









Sarcasm, maths, chemistry pairs are NOT matched in training-data size or composition; the anger pair IS matched (same data except the author). Plain-prompt false-alarm cost is about 0.4% for every probe, so the last panel's gaps are not head starts.
